

Brief portfolio Cyril ETIEVANT

For this application project we have 7 different views.

- **Loading Page:** For this page, the C logo turn in a circle for the loading indicator. At the end, the logo stop turn, go at the top, take the position for the main page. Black div go at the bottom and become the footer.
- **Main Page:** For this one, a text from the footer appears by opacity 0 until 1. Same for the Button Menu. The main text appears like it is typing.
- **Menu page:** When the user click on the menu Button, 3 Div appears. The first come on the left side. The second on the right and the last by the left again. If one is selected the other go away by slide again.
- **Project page:** A new button is available, the Home button. For UI make a little animation. Like that the user know it's an active button. On click the user go to the main page. For this page, we can see different project. If the user select one, on touch, the selected project take more place like he scales. The top and bottom project go away by their respective side.
- **Focus project page:** On the top of the page we have a button return who make the previous page. The project go away with a scale animation and different projects come back. We have in the main div a project description with picture, job, date etc. On the top and bottom we have to push a button to see the other project with the same view.
- **Contact Page:** On this page we have a contact form. Maybe add the phone number, mail etc. Need look for an animation. Maybe if the user touch send, the form go on an envelope who go away by a side. After submit, user is redirect on the main page.
- **Skill page:** For this one, skill are display. Maybe we can add a random move by each div with a collision management.

For this project I will use Angular2. After past some time on job offer, many of them looking for this one so I think is good for my future to use Angular2. Moreover it's a hard technology at the beginning and it's a good idea to encourage me at this hard work.
